

# TSX561, TSX562, TSX564, TSX561A, TSX562A, TSX564A

Micropower, wide bandwidth (900 kHz), 16 V CMOS operational amplifiers

Datasheet - production data

### **Features**

Low power consumption: 235 μA typ. at 5 V

• Supply voltage: 3 V to 16 V

Gain bandwidth product: 900 kHz typ.

Low offset voltage

- "A" version: 600 μV max.- Standard version: 1 mV max.

Low input bias current: 1 pA typ.

High tolerance to ESD: 4 kV

Wide temperature range: -40 to +125 °C

Automotive qualification

• Tiny packages available

- SOT23-5

DFN8 2 mm x 2 mm, MiniSO8, SO8

QFN16 3 mm x 3 mm, TSSOP14

#### **Benefits**

- Power savings in power-conscious applications
- Easy interfacing with high impedance sensors

#### **Related products**

- See TSX63x series for reduced power consumption (45 μA, 200 kHz)
- See TSX92x series for higher gain bandwidth products (10 MHz)

### **Applications**

- Industrial and automotive signal conditioning
- Active filtering
- · Medical instrumentation
- High impedance sensors

### Description

The TSX56x, TSX56xA series of operational amplifiers benefit from STMicroelectronics  $^{\circledR}$  16 V CMOS technology to offer state-of-the-art accuracy and performance in the smallest industrial packages. The TSX56x, TSX56xA have pinouts compatible with industrial standards and offer an outstanding speed/power consumption ratio, 900 kHz gain bandwidth product while consuming only 250  $\mu\text{A}$  at 16 V. Such features make the TSX56x, TSX56xA ideal for sensor interfaces and industrial signal conditioning. The wide temperature range and high ESD tolerance ease use in harsh automotive applications.

- 1. All voltage values, except differential voltage, are with respect to network ground terminal.
- 2. The differential voltage is the non-inverting input terminal with respect to the inverting input terminal.
- 3. V<sub>CC</sub> V<sub>in</sub> must not exceed 18 V, V<sub>in</sub> must not exceed 18 V.
- 4. Input current must be limited by a resistor in series with the inputs.
- 5. Short-circuits can cause excessive heating and destructive dissipation.
- 6. R<sub>th</sub> are typical values.
- 7. Human body model: 100 pF discharged through a 1.5  $k\Omega$  resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
- 8. Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5  $\Omega$ ), done for all couples of pin combinations with other pins floating.
- Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

### 4 Application information

### 4.1 Operating voltages

The amplifiers of the TSX56x and TSX56xA series can operate from 3 V to 16 V. Their parameters are fully specified at 3.3 V, 5 V and 16 V power supplies. However, the parameters are very stable in the full  $V_{CC}$  range. Additionally, the main specifications are guaranteed in extended temperature ranges from -40 to +125 ° C.

### 4.2 Rail-to-rail input

The TSX56x and TSX56xA devices are built with two complementary PMOS and NMOS input differential pairs. The devices have a rail-to-rail input, and the input common mode range is extended from  $V_{CC-}$  - 0.1 V to  $V_{CC+}$  + 0.1 V.

However, the performance of these devices is clearly optimized for the PMOS differential pairs (which means from  $V_{CC-}$  - 0.1 V to  $V_{CC+}$  - 1.5 V).

Beyond  $V_{CC+}$  - 1.5 V, the operational amplifiers are still functional but with degraded performance, as can be observed in the electrical characteristics section of this datasheet (mainly  $V_{io}$  and GBP). These performances are suitable for a number of applications needing to be rail-to-rail.

The devices are designed to prevent phase reversal.

### 4.3 Input offset voltage drift over temperature

The maximum input voltage drift over the temperature variation is defined as the offset variation related to the offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effects of temperature variations.

The maximum input voltage drift over temperature is computed in *Equation 1*.

#### **Equation 1**

$$\frac{\Delta V_{io}}{\Delta T} = \text{max} \left| \frac{V_{io}(T) - V_{io}(25^{\circ}C)}{T - 25^{\circ}C} \right|$$

with T = -40 °C and 125 °C.

The datasheet maximum value is guaranteed by measurement on a representative sample size ensuring a  $C_{pk}$  (process capability index) greater than 2.

### 4.4 Long term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using *Equation 2*.

#### **Equation 2**

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

#### Where:

A<sub>FV</sub> is the voltage acceleration factor

 $\beta$  is the voltage acceleration constant in 1/V, constant technology parameter ( $\beta$  = 1)

 $V_S$  is the stress voltage used for the accelerated test

V<sub>II</sub> is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in Equation 3.

#### **Equation 3**

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left(\frac{1}{T_U} - \frac{1}{T_S}\right)}$$

#### Where:

A<sub>FT</sub> is the temperature acceleration factor

Ea is the activation energy of the technology based on the failure rate

k is the Boltzmann constant (8.6173 x  $10^{-5}$  eV.K<sup>-1</sup>)

 $T_U$  is the temperature of the die when  $V_U$  is used (K)

T<sub>S</sub> is the temperature of the die under temperature stress (K)

The final acceleration factor,  $A_F$ , is the multiplication of the voltage acceleration factor and the temperature acceleration factor (*Equation 4*).

#### **Equation 4**

$$A_F = A_{FT} \times A_{FV}$$

 $A_F$  is calculated using the temperature and voltage defined in the mission profile of the product. The  $A_F$  value can then be used in *Equation 5* to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

#### **Equation 5**

Months =  $A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$ 

To evaluate the op-amp reliability, a follower stress condition is used where  $V_{CC}$  is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The  $V_{io}$  drift (in  $\mu V$ ) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see *Equation 6*).

#### **Equation 6**

$$V_{CC} = maxV_{op}$$
 with  $V_{icm} = V_{CC} / 2$ 

The long term drift parameter ( $\Delta V_{io}$ ), estimating the reliability performance of the product, is obtained using the ratio of the  $V_{io}$  (input offset voltage value) drift over the square root of the calculated number of months (*Equation 7*).

#### **Equation 7**

$$\Delta V_{io} = \frac{V_{io} drift}{\sqrt{(months)}}$$

where  $V_{io}$  drift is the measured drift value in the specified test conditions after 1000 h stress duration.

### 4.5 PCB layouts

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

#### 4.6 Macromodel

Accurate macromodels of the TSX56x, TSX56xA devices are available on the STMicroelectronics' website at *www.st.com*. These models are a trade-off between accuracy and complexity (that is, time simulation) of the TSX56x and TSX56xA operational amplifiers. They emulate the nominal performance of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the right operational amplifier, *but they do not replace on-board measurements*.

Package information TSX56x, TSX56xA

# 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: <a href="www.st.com">www.st.com</a>. ECOPACK is an ST trademark.

TSX56x, TSX56xA Revision history

# 7 Revision history

Table 14. Document revision history

Date	Revision	Changes
06-Jun-2012	1	Initial release.
18-Sep-2012	2	Added TSX562, TSX564, TSX562A, and TSX564A devices. Updated Features, Description, Figure 1, Table 1 (added DFN8, MiniSO8, QFN16, and TSSOP14 package). Updated Table 1 (updated ESD MM values). Updated Table 4 and Table 5 (added footnotes), Section 5 (added Figure 24 to Figure 28 and Table 8 to Table 12), Table 13 (added dual and quad devices). Minor corrections throughout document.
23-May-2013	3	Replaced the silhouette, pinout, package diagram, and mechanical data of the DFN8 2x2 and QFN16 3x3 packages.  Added Benefits and Related products.  Table 1: updated R <sub>thja</sub> values and added R <sub>thjc</sub> values for DFN8 2x2 and QFN16 3x3.  Updated Section 4.3, Section 4.4, and Section 4.6  Replaced Figure 23: SOT23-5 package mechanical drawing and Table 7: SOT23-5 package mechanical data.
09-Aug-2013	4	Added SO8 package for dual version TSX562 and TSX562A. <i>Table 2</i> : updated for SO8 package <i>Table 13</i> : added order codes TSX562IDT, TSX562IYDT, TSX562AIDT, TSX562AIYDT; updated automotive grade status.

#### Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.
