*Read instruction manual carefully, before using the power supply unit.

=NOTES=

- *1. At 115VAC/230VAC, Ta=25°C, Nominal output voltage and maximum output power.
- *2. For cases where conformance to various safety specs (UL, CSA, EN) are required, input voltage range will be 100 ~ 240VAC (50-60Hz). Output derating required when Vin is less than 115VAC, refer to output derating curve for details.
- *3. Not applicable for the in-rush current to Noise Filter for less than 0.2ms.
- *4. Please refer to Fig. A for measurement of Vo, line and load regulation and ripple voltage.
- *5. Ripple & noise are measured at 20MHz by using a 150mm twisted pair of load wires terminated with a 0.1uF and 100uF capacitor.
- *6. 85~265VAC, constant load
- *7. No load full load, constant input voltage.
- *8. Hiccup with automatic recovery
 - Avoid to operate at over load or short circuit condition.
- *9. OVP circuit shut down the output, manual reset (Repower on) to get output voltage.
- *10. Measured by the each measuring method of UL, CSA, and EN (at 60 Hz), Ta= $25 ^{\circ} C$.
- *11. Refer to output derating curve for details of output derating versus input voltage, ambient temperature and mounting method.
 - Load (%) is percent of maximum output power or maximum output current.
 - Do not exceed its derating of Maximum Load.
- *12. The power consumption refers to input power during remote off and standby mode power is at no load condition.
- *13. Forced air cooling with air velocity more than 1.5m/s (measured at component side, air must flow through component side)
