

**UltraCMOS® SP4T RF Switch  
10 Hz–8 GHz**

**Features**

- HaRP™ technology enhanced
  - Fast settling time
  - Eliminates gate and phase lag
  - No drift in insertion loss and phase
- High linearity: 58 dBm IIP3
- Low insertion loss: 0.8 dB @ 3 GHz, 1.0 dB @ 6 GHz and 1.2 dB @ 8 GHz
- High isolation: 45 dB @ 3 GHz, 39 dB @ 6 GHz and 31 dB @ 8 GHz
- Maximum power handling: 30 dBm @ 8 GHz
- High ESD tolerance of 2 kV HBM on RFC and 1 kV HBM on all other pins

**Product Description**

The PE42540 is a HaRP™ technology-enhanced absorptive SP4T RF switch developed on UltraCMOS® process technology. This switch is designed specifically to support the requirements of the test equipment and ATE market. It comprises four symmetric RF ports and has very high isolation. An on-chip CMOS decode logic facilitates a two-pin low voltage CMOS control interface and an optional external  $V_{SS}$  feature. High ESD tolerance and no blocking capacitor requirements make this the ultimate in integration and ruggedness.

The PE42540 is manufactured on Peregrine's UltraCMOS process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

### Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the specified rating.

### Latch-Up Immunity

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

### Switching Frequency

The PE42540 has a maximum 25 kHz switching rate when the internal negative voltage generator is used (pin 31 = GND). The rate at which the PE42540 can be switched is only limited to the switching time (*Table 1*) if an external negative supply is provided at (pin 31 = V<sub>SS\_EXT</sub>).

### Optional External V<sub>ss</sub>

For proper operation, the V<sub>SS\_EXT</sub> pin must be grounded or tied to the V<sub>ss</sub> voltage specified in *Table 3*. When the V<sub>SS\_EXT</sub> pin is grounded, FETs in the switch are biased with an internal voltage generator. For applications that require the lowest possible spur performance, V<sub>SS\_EXT</sub> can be applied externally to bypass the internal negative voltage generator.

### Spurious Performance

The typical spurious performance of the PE42540 is -144 dBm when V<sub>SS\_EXT</sub> = 0V (pin 31 = GND). If further improvement is desired, the internal negative voltage generator can be disabled by setting V<sub>SS\_EXT</sub> = -V<sub>DD</sub>.

### Moisture Sensitivity Level

The moisture sensitivity level rating for the PE42540 in the 32-lead 5 × 5 mm LGA package is MSL3.

## Low Frequency Operation

Table 6 shows the minimum and maximum voltage limits when operating the device under various  $V_{DD}$  and  $V_{SS\_EXT}$  voltage conditions below 9 kHz. Refer to Figures 4, 5 and 6 to determine the maximum operating power over the frequency range of the device.

**Table 6. Instantaneous RF Voltage Limits for Operation Below 9 kHz**

$V_{DD}$	$V_{SS\_EXT}$	Minimum Peak Voltage at RF Port	Maximum Peak Voltage at RF Port
$\geq 3.0$	0.0	-0.2	1.2
3.0	-3.0	-0.6	1.6
3.3	-3.3	-0.3	1.3
3.5	-3.5	-0.1	1.1
3.6	-3.6	0.0	1.0

## Maximum Operating Power vs Frequency

Figures 4, 5 and 6 show the power limit of the device will increase with frequency. As the frequency increases, the contours and maximum power limit will increase as shown in the curves.

## Thermal Data

Psi-JT ( $\Psi_{JT}$ ), junction top-of-package, is a thermal metric to estimate junction temperature of a device on the customer application PCB (JEDEC JESD51-2).

$$\Psi_{JT} = (T_J - T_T)/P$$

where

$\Psi_{JT}$  = junction-to-top of package characterization parameter, °C/W

$T_J$  = die junction temperature, °C

$T_T$  = package temperature (top surface, in the center), °C

P = power dissipated by device, Watts

### Evaluation Kit

The SP4T switch evaluation board was designed to ease customer evaluation of Peregrine's PE42540. The RF common port is connected through a 50Ω transmission line via the top SMA connector, J1. RF1, RF2, RF3 and RF4 are connected through 50Ω transmission lines via SMA connectors J2, J4, J3 and J5, respectively. A through 50Ω transmission is available via SMA connectors J6 and J7. This transmission line can be used to estimate the loss of the PCB over the environmental conditions being evaluated.
