

1 A Slew Rate Controlled Load Switch with Reverse Blocking

DESCRIPTION

The SiP32431 is a slew rate controlled high side switch with reverse blocking capability. The switch is of a low ON resistance p-channel MOSFET that supports continuous current up to 1 A.

The SiP32431 operates with an input voltage from 1.5 V to 5.5 V.

The SiP32431 features low input logic level to interface with low control voltage from microprocessors. This device has a very low operating current, typically 50 pA.

The SiP32431 is available in lead (Pb)-free package options including 6 pin SC70-6, and 4 pin TDFN4 1.2 mm x 1.6 mm DFN4 packages. The operation temperature range is specified from -40 °C to +85 °C.

The SiP32431 compact package options, operation voltage range, and low operating current make it a good fit for battery power applications.

FEATURES

- 1.5 V to 5.5 V input voltage range
- Very low $R_{DS(on)}$, typically 105 mΩ at 5 V and 135 mΩ at 3 V for TDFN4 1.2 mm x 1.6 mm package
- Typical 147 mΩ at 5 V and 178 mΩ at 3 V for SC70-6 package
- Slew rate controlled turn-on time: 100 μs
- Low quiescent current < 1 μA
- Low shutdown current < 1 μA
- Reverse blocking capability
- SC70-6 and TDFN4 1.2 mm x 1.6 mm packages
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

APPLICATIONS

- Cellular telephones
- Digital still cameras
- Personal digital assistants (PDA)
- Hot swap supplies
- Notebook computers
- Personal communication devices
- Portable Instruments

TYPICAL APPLICATION CIRCUIT

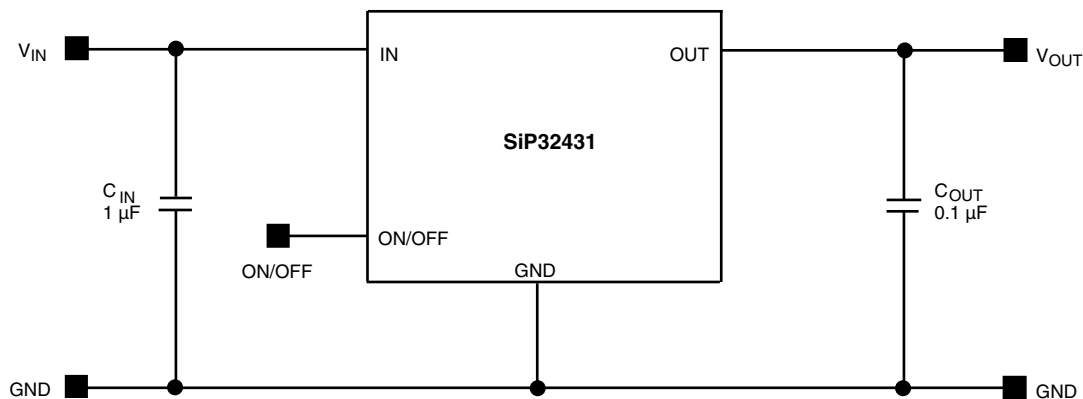

Fig. 1 - SiP32431 Typical Application Circuit

ORDERING INFORMATION			
TEMPERATURE RANGE	PACKAGE	MARKING	PART NUMBER
-40 °C to +85 °C	SC70-6	MAxx	SiP32431DR3-T1GE3
	TDFN4 1.2 mm x 1.6 mm	Dx	SiP32431DNP3-T1GE4

Notes

- x = lot code
- -GE3 denotes halogen-free and RoHS-compliant
- Please use the SiP32431DR3-T1GE3 to replace SiP32431DR3-T1-E3

ABSOLUTE MAXIMUM RATINGS			
PARAMETER		LIMIT	UNIT
Supply input voltage (V_{IN})		-0.3 to +6	V
Enable input voltage ($V_{ON/OFF}$)		-0.3 to +6	
Output voltage (V_{OUT})		-0.3 to $V_{IN} + 0.3$	
Maximum continuous switch current ($I_{max.}$)	SC70-6 package	1.2	A
	TDFN4 1.2 mm x 1.6 mm	1.4	
Maximum pulsed current (I_{DM}) V_{IN} (pulsed at 1 ms, 10 % duty cycle)	$V_{IN} \geq 2.5$ V	3	
	$V_{IN} < 2.5$ V	1.6	
ESD rating (HBM)		4000	V
Junction temperature (T_J)		-40 to +125	°C
Thermal resistance (θ_{JA}) ^a	6 pin SC70-6 ^b	220	°C/W
	4 pin TDFN4 1.2 mm x 1.6 mm ^c	170	
Power dissipation (P_D) ^a	6 pin SC70-6 ^b	250	mW
	4 pin TDFN4 1.2 mm x 1.6 mm ^c	324	

Notes

- a. Device mounted with all leads and power pad soldered or welded to PC board
- b. Derate 4.5 mW/°C above $T_A = 70$ °C
- c. Derate 5.9 mW/°C above $T_A = 70$ °C, see PCB layout

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating/conditions for extended periods may affect device reliability.

DETAILED DESCRIPTION

The SiP32431 is a p-channel MOSFET power switches designed for high-side slew rate controlled load-switching applications. Once turned on, the slew-rate control circuitry is activated and current is ramped in a linear fashion until it reaches the level required for the output load condition. This is accomplished by first elevating the gate voltage of the MOSFET up to its threshold voltage and then by linearly increasing the gate voltage until the MOSFET becomes fully enhanced. At this point, the gate voltage is then quickly increased to the full input voltage to reduce $R_{DS(on)}$ of the MOSFET switch and minimize any associated power losses.

APPLICATION INFORMATION
Input Capacitor

While a bypass capacitor on the input is not required, a $1\ \mu\text{F}$ or larger capacitor for C_{IN} is recommended in almost all applications. The bypass capacitor should be placed as physically close as possible to the SiP32431 to be effective in minimizing transients on the input. Ceramic capacitors are recommended over tantalum because of their ability to withstand input current surges from low impedance sources such as batteries in portable devices.

Output Capacitor

A $0.1\ \mu\text{F}$ capacitor or larger across V_{OUT} and GND is recommended to insure proper slew operation. C_{OUT} may be increased without limit to accommodate any load transient condition with only minimal affect on the SiP32431 turn on slew rate time. There are no ESR or capacitor type requirement.

Enable

The on/off pin is compatible with both TTL and CMOS logic voltage levels.

Protection Against Reverse Voltage Condition

The SiP32431 contains a body snatcher that normally connect the body to the source (IN) when the device is enable. In case where the device is disabled but the V_{OUT} is higher than the V_{IN} , the n-type body is switched to OUT, reverse bias the body diode to prevent the current from going back to the input.

Thermal Considerations

The SiP32431 is designed to maintain a constant output load current. Due to physical limitations of the layout and assembly of the device the maximum switch current is 1 A, as stated in the Absolute Maximum Ratings table. However, another limiting characteristic for the safe operating load current is the thermal power dissipation of the package. To obtain the highest power dissipation (and a thermal resistance of $170\ ^\circ\text{C}/\text{W}$) the power pad of the device should be connected to a heat sink on the printed circuit board.

The maximum power dissipation in any application is dependent on the maximum junction temperature, $T_{J(max.)} = 125\ ^\circ\text{C}$, the junction-to-ambient thermal resistance for the TDFN4 1.2 mm x 1.6 mm package, $\theta_{J-A} = 170\ ^\circ\text{C}/\text{W}$, and the ambient temperature, T_A , which may be formulaically expressed as:

$$P(\text{max.}) = \frac{T_{J(max.)} - T_A}{\theta_{J-A}} = \frac{125 - T_A}{170}$$

It then follows that, assuming an ambient temperature of $70\ ^\circ\text{C}$, the maximum power dissipation will be limited to about 324 mW.

So long as the load current is below the 1 A limit, the maximum continuous switch current becomes a function two things: the package power dissipation and the $R_{DS(on)}$ at the ambient temperature.

As an example let us calculate the worst case maximum load current at $T_A = 70\text{ }^\circ\text{C}$. The worst case $R_{DS(on)}$ at $25\text{ }^\circ\text{C}$ occurs at an input voltage of 1.5 V and is equal to $520\text{ m}\Omega$. The $R_{DS(on)}$ at $70\text{ }^\circ\text{C}$ can be extrapolated from this data using the following formula

$$R_{DS(on)}(\text{at } 70\text{ }^\circ\text{C}) = R_{DS(on)}(\text{at } 25\text{ }^\circ\text{C}) \times (1 + T_C \times \Delta T)$$

Where T_C is $3300\text{ ppm}/^\circ\text{C}$. Continuing with the calculation we have

$$R_{DS(on)}(\text{at } 70\text{ }^\circ\text{C}) = 520\text{ m}\Omega \times (1 + 0.0033 \times (70\text{ }^\circ\text{C} - 25\text{ }^\circ\text{C})) = 597\text{ m}\Omega$$

The maximum current limit is then determined by

$$I_{LOAD(max)} < \sqrt{\frac{P(max.)}{R_{DS(on)}}}$$

which in case is 0.74 A. Under the stated input voltage condition, if the 0.74 A current limit is exceeded the internal die temperature will rise and eventually, possibly damage the device.

Vishay Siliconix maintains worldwide manufacturing capability. Products may be manufactured at one of several qualified locations. Reliability data for Silicon Technology and Package Reliability represent a composite of all qualified locations.
